

March 2007

■ FEATURED PRODUCT: PC2-8500 Reaper HPC

OCZ is adding to their industry-leading recognition in ultra-high performance memory modules with the design and development of integrated proprietary thermal management solutions. First OCZ introduced the innovative and sleek XTC (Xtreme Thermal Convection) heatspreader that is now incorporated in the entire gaming and high performance memory lineups. After a successful launch of three enthusiast-grade Flex XLC (Xtreme Liquid Convection) kits that feature the Flex heatsink, alterable between air and water cooling, OCZ has developed yet another exclusive memory heatsink.

The new OCZ Reaper HPC (Heat Pipe Conduit) is an innovative cooling solution developed by OCZ to effectively minimize heat produced by high-speed memory. As heat rises into the thermo-conductive copper heat pipe conduit, it is dissipated through the strategically-placed compact aluminum fin array. By guiding performance-robbing heat away from key memory components, the unique Reaper HPC design helps facilitate improved overclocking performance, while improving longevity and stability of the modules.

Although the OCZ Reaper HPC series was coined for enthusiasts, EPP eliminates the need for manual configuration and makes memory optimizations a household item for the complete range of consumers looking to maximize system performance through overclocking.

■ CeBIT is here!

As OCZ's European customer and fan base continues to grow, each CeBIT becomes more exciting than the next. This year OCZ will be reviving the industry, introducing new technology, and raising the bar of performance at CeBIT 2007. In one year, OCZ has expanded their product line into several new sectors, offering their innovative, high-tech mentality to more consumers.

Come see true enthusiast potential, leading-edge solutions, and find out how OCZ can take high power PCs to the next level.

You can find us in Hall 21, Stand A32. Please stop by the OCZ stand to check out what OCZ has planned for 2007!

■ OCZ[®] EDGE

ProXStream Leaves IT Review "Speechless"!

"This would be the first product introduced to the "Hall of Fame"... This thing fits into cases like Silverstone's La Scala with a LOT of space left all around it and the cables are long enough (even more than enough) to do everything and do it while being very tidy... I'd give this thing two Editor's choices if I could!"

PC Perspective Awards the PC2-9200 Flex their Editor's Choice!

"If you are in the market for the ultimate enthusiast memory solution, OCZ Technology's Flex XLC modules fit that bill perfectly. Offering not only superb passive cooling, the XLC cooling solution can supply even lower memory temperatures with the option for liquid cooling. OCZ's latest offering for the enthusiast really impresses!"

ProXStream is a TweakTown "Must Have" Product!

"Bottom line... If you're in the market for a power supply that has enough power to handle the most hardcore of enthusiast rigs with the capability of running quad graphics and dual dual-core processors, the OCZ ProXStream 1000 should be at the top of your list. With a power flow that is about as close to flawless as you will ever see and the ability to handle a 70A power draw from the 12 rails, you simply have to see this thing to believe it!"
